# Introduction

- Online discussion forums have become increasingly popular in recent years as a means of facilitating communication and discussion among people with common interests or goals.
  - These forums allow users to share ideas, information, and opinions on a variety of topics, including education, politics, entertainment, and technology.
  - It provides a platform for people to connect, share experiences, and build relationships with others from around the world.
- 

# Objective

- Global connectivity: Online discussion forums provide a platform for individuals from different parts of the world to connect and engage in discussions.
- Knowledge sharing: Discussion forums enable users to share ideas, information, and expertise on specific topics. Users can ask questions, seek advice, and receive insights from others
- Community building: Online forums provide a space for like-minded individuals to come together and form communities centered around shared interests or goals.

# Technology used:

## Frontend Technology:

- HTML
- CSS
- JavaScript

## Backend Technology:

- Django
  - REST API
- 

# Front-End Technology

- Front-end web development also known as client-side development is the practice of producing HTML, CSS and JavaScript for a website so that a user can see and interact with them directly.
- The objective of designing a site is to ensure that when the users open up the site they see the information in a format that is easy to read and relevant.

# HTML(Hypertext Markup Language)

- HTML is the standard markup Language for creating web pages and web applications.
- Web browsers receive HTML documents from a web server or from local storage and render the documents into multimedia web pages.
- HTML describes the structure of a web pages.

```
1  <!DOCTYPE html>
2  <html>
3    <head>
4      <meta charset="UTF-8">
5      <title>Title goes here</title>
6    </head>
7    <body>
8
9    </body>
10 </html>
```

# CSS (Cascading Style Sheets)

- CSS is a style sheet language used for describing the presentation of a document written in a markup language like HTML.
- CSS is designed to enable the separation of presentation and content, including layout, colors, and fonts.

```
body {  
  font: x-small;  
  background: #  
  color: black;  
  margin: 0;  
  padding: 0;
```

# JavaScript

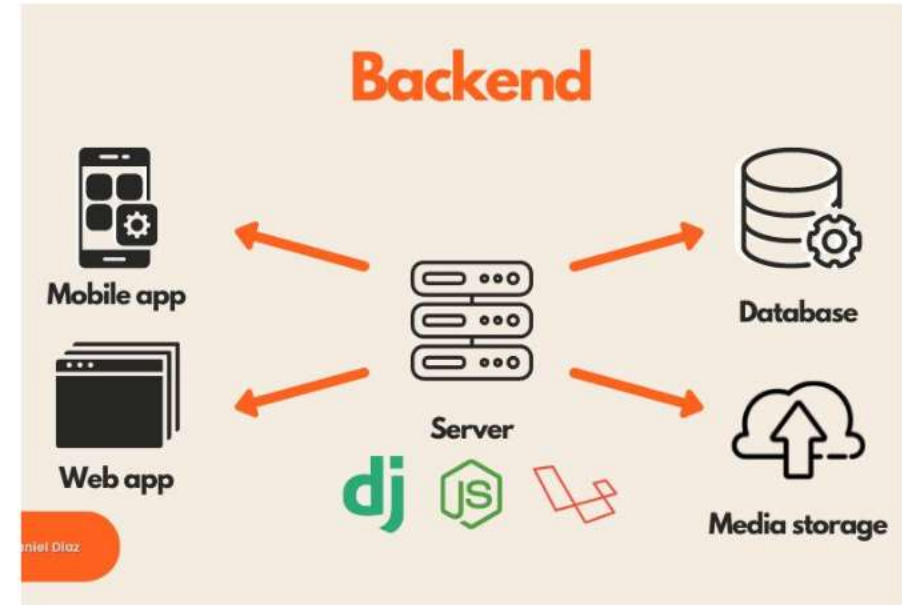

- A high-level, interpreted programming. It is a dynamic language.
- JavaScript enables interactive web pages and is an essential part of web applications.
- The vast majority of websites use it, and major web browsers have a dedicated JavaScript engine to execute it.

# Back-End Technology

- Back-end Development refers to the server side of an application and everything that communicates between the database and the browser.
- Typically, backend technologies refer to the libraries of server-side languages that are used to create the server configuration of a website.
- The backend technologies form the basis of software development.

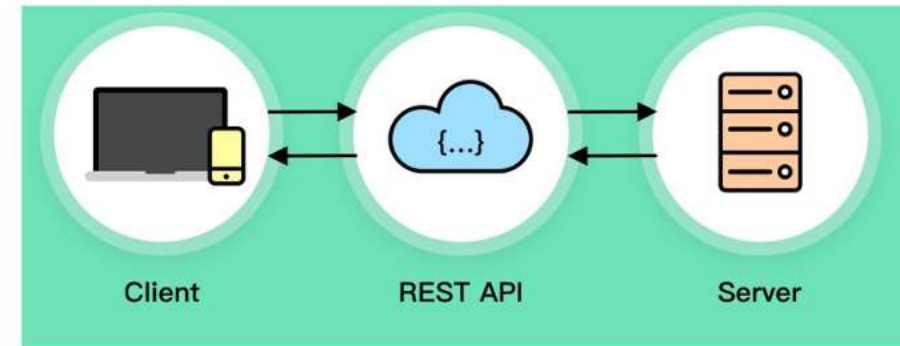

# Django

- Django is a web application framework written in Python programming language.
- It is based on MVC(Model View Controller) design pattern.
- Django is very demanding due to its rapid development feature.
- It take less time to build application after collecting client requirement

# REST API

- REST stands for Representational State Transfer.
- Representational state transfer (REST) is a set of architectural principles.
- This means that when a client requests a resource using a REST API, the server transfers back the current state of the resource in a standardized representation a subheading

# ARCHITECTURE

MVC (Model-View-Controller) is a software architectural pattern that separates an application into three interconnected components: the Model, the View, and the Controller.

## **Model:**

- The Model represents the application's data and business logic.
- It encapsulates the data and provides methods to access and manipulate it.

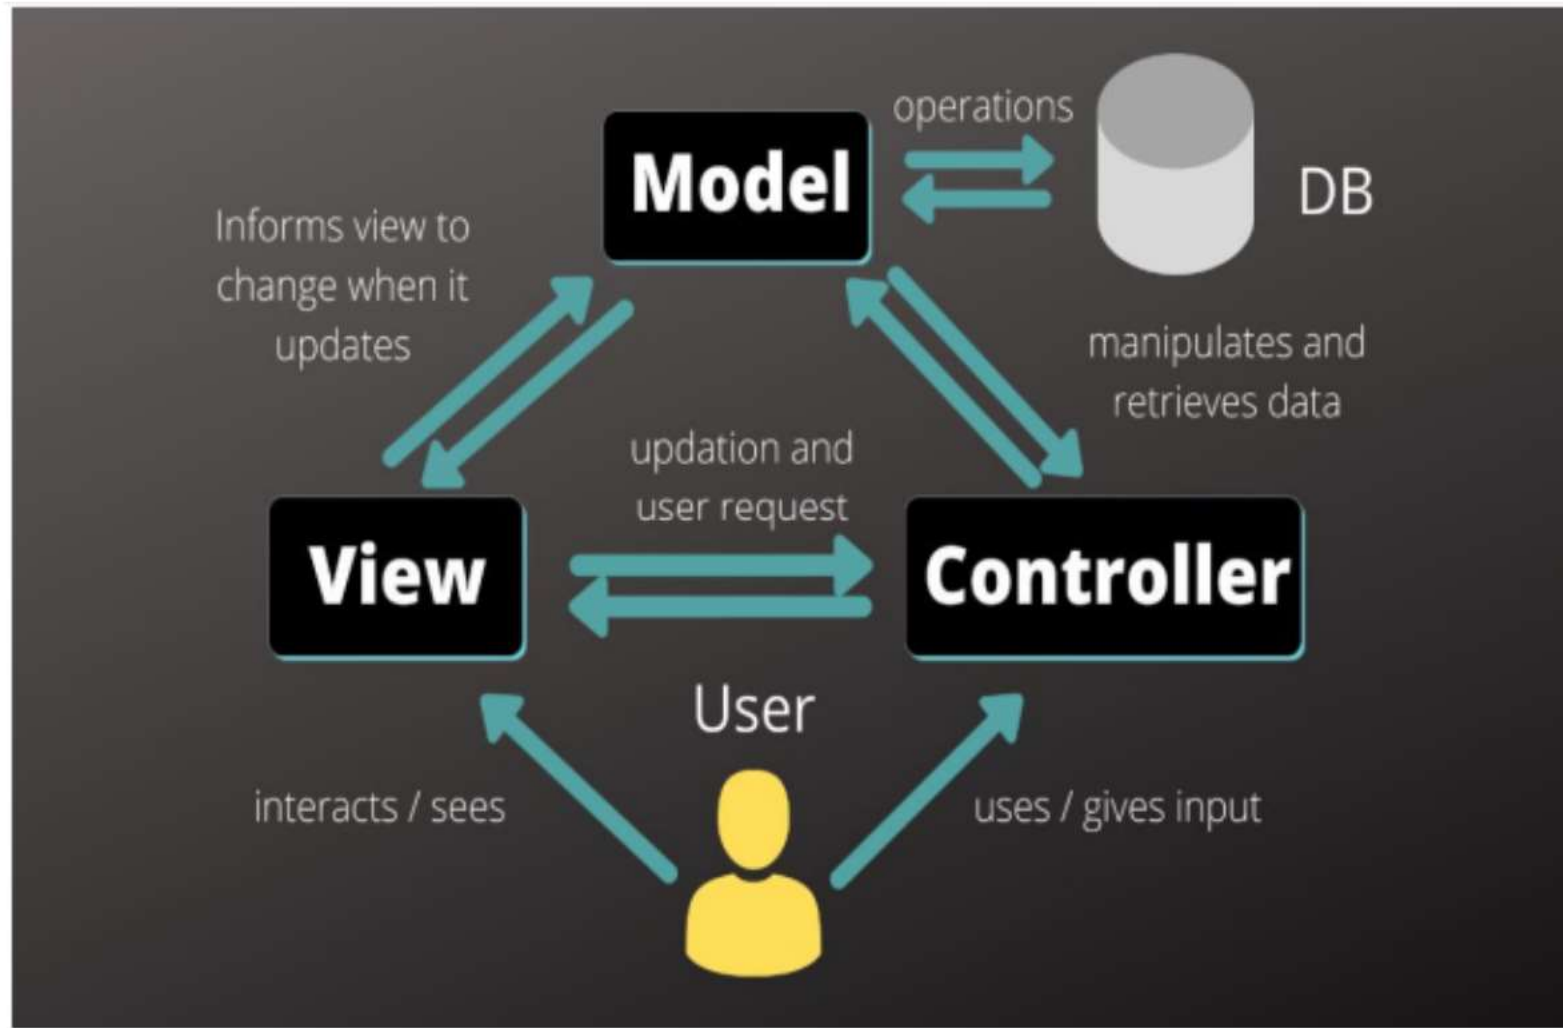

## **View:**

- The View is responsible for the presentation layer of the application.
- It defines how the data is displayed to the user.
- It receives input from the user and sends it to the Controller for further processing.

## **Controller:**

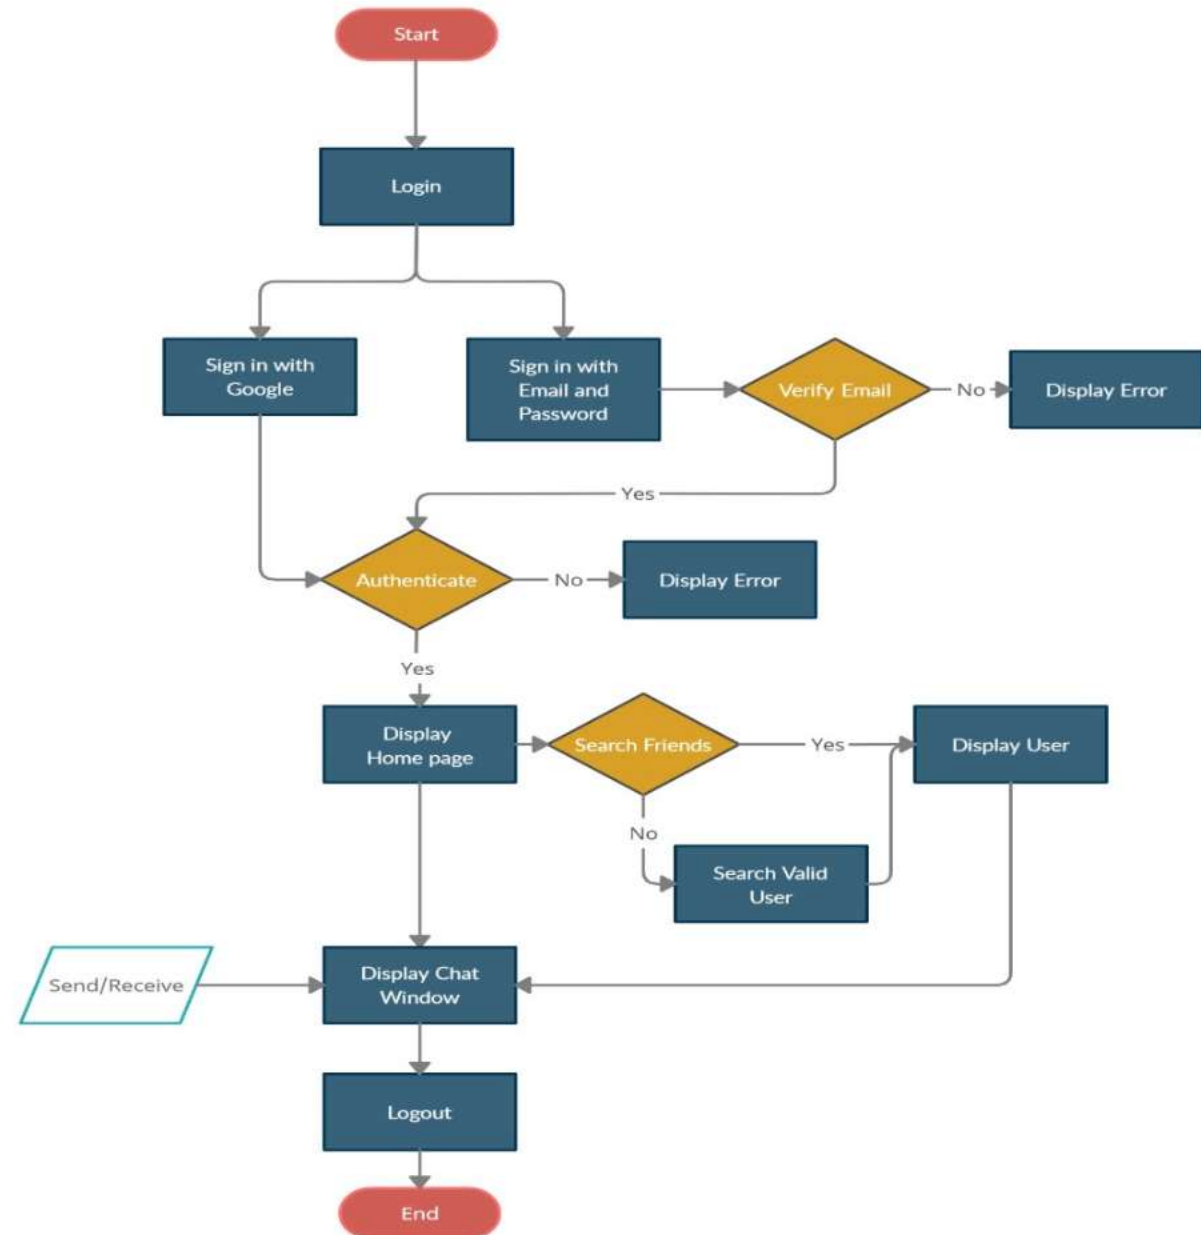

- The Controller acts as an intermediary between the Model and the View.
- It receives user input from the View and decides how to handle it.

# MVC Flow Diagram

# Flowchart

# Features

- Optimized database queries with advanced indexing techniques and query optimization strategies for lightning-fast data retrieval.
- Implemented caching mechanisms, such as in-memory caching and content delivery network integration, to minimize server load and achieve near-instantaneous page loading.
- Leveraged Django's ORM framework to establish and manage complex database relationships effortlessly.
- Developed a customizable admin panel using Django's built-in interface for efficient data management and comprehensive control over the application.
- Improved user experience through reduced response times, streamlined data operations, and enhanced code maintainability.

Thank  
you
